

Faculty of Computing

Year 2 Semester 1 (2026)

IT2011 - Artificial Intelligence and Machine Learning

Proposal Presentation

1. Assigned Dataset

- Your group will be assigned a specific open-source dataset by the module coordinators (dataset selection is not required) .
- Note the dataset source and provide a direct link/citation to it in your slides.
- Review the dataset's structure (features, target variable, size, and format) before the presentation.

2. Problem Domain Identification

- Clearly define the real-world problem you intend to address using the assigned dataset (e.g., healthcare, finance, agriculture, education).
- Ensure strong alignment between the assigned dataset and the problem domain you propose.

3. Dataset Justification

- Provide a clear analysis of the assigned dataset's suitability for your chosen problem.
- Discuss features, target variable, size, and quality.
- Note any limitations of the dataset and how your group intends to address them (optional, but encouraged).

4. Planned AI Tool Usage

- Briefly outline which generative AI tools (if any) your group plans to use over the course of the project and for which tasks (e.g., coding assistance, EDA interpretation, report drafting).
- This is a preliminary plan — the final AI Tool Usage Declaration in the group report should reflect what was actually used.

Proposal Presentation Details

- Format: Slide-based presentation (PowerPoint)
- Duration: 15 minutes per group
- Mode: In-class during Lab Sessions
- Date and Time: During Lab sessions of 1st Week of August (starting week - 3rd August 2026; tentative)
- Slides Should Include: Assigned Dataset (source + link); Problem Domain (real-world context); Dataset Justification (features, labels, size, quality); Planned AI Tool Usage (brief)
